

Gas Volume Calculator

iOS Application

Help Document

This application is used to calculate the amount of gas flow through a meter with a specific size and an orifice plate of known size as well. You need to know your gas temperature, pressure, and differential pressure across the plate. Once you have input all of the information in the app, you can click the “calculate” button. The app will notify you if you are out of beta with a text box that turns red.

You can select the help button and a new screen will open that shows you standard meter sizes if you do not know, or cannot find a marking on your meter that tells you its bore size.
